CREATE-MIGRATION

 Copy as Markdown

serverpod create-migration

The `serverpod create-migration` command compares your current models and database definition to the last migration and writes a new migration for the difference. Run it after changing your model files.

Use `--force` to proceed when a change may drop data, `--tag` to label the revision (lowercase letters, numbers, and dashes only), or `--empty` to create a migration even when nothing has changed. For the full workflow, see [Migrations](#).

Usage

Creates a migration from the last migration to the current state of the database.

Usage: `serverpod create-migration [arguments]`

<code>-h, --help</code>	Print this usage information.
<code>--empty</code>	Creates the migration even if there are no database changes.
<code>-f, --force</code>	Creates the migration even if there are warnings or information that may be destroyed.
<code>-t, --tag</code>	Add a tag to the revision to easier identify it.

Run "serverpod help" to see global options.
