## serverpod mcp-server

`serverpod mcp-server` starts a Model Context Protocol bridge to the `serverpod start` runner of a server project, letting an AI assistant build, run, and inspect your server.

The server directory is auto-detected from the current working directory. Pass `--server-dir` explicitly in monorepos that contain more than one server project.

### Usage

Start an MCP bridge to the ``serverpod start`` runner of one server project.

Usage: `serverpod mcp-server`

`-h, --help` Print this usage information.

`-s, --server-dir` Path to the server project directory (the package that contains a ``serverpod`` dependency). Auto-detected from the current working directory if omitted. Pass this flag explicitly in monorepos with multiple server projects.

Run `"serverpod help"` to see global options.
